

## Instructions

Note : This includes mysql , php, apache2 configurational setups. Easy access to that is the links I mentioned at the bottom.

STEP 1 : Install Apache2

```
Php
php-mysql
sudo ufw allow 'Apache'
sudo ufw allow 'mysql'
```

STEP 2 : Open Ports:

```
80
22
3306
```

STEP 3 : Include all files in the server in the directory of apache2  
Generally in /var/www/html/all files individually (No Folders)

STEP 4 : configure mysql and hosts with dns.  
Generally vi /etc/hosts

ip:dns

STEP 5 : Create Database and required tables

STEP 6 : Run in the browser with the ip address

-----

NOTE: I have already integrated all of this in my server. Just Include all files in /var/www/html individually .

Check the vi /etc/hosts like below

```
127.0.0.1 localhost
18.219.132.59 ec2-18-219-132-59.us-east-2.compute.amazonaws.com
# The following lines are desirable for IPv6 capable hosts
::1 ip6-localhost ip6-loopback
fe00::0 ip6-localnet
ff00::0 ip6-mcastprefix
ff02::1 ip6-allnodes
ff02::2 ip6-allrouters
ff02::3 ip6-allhosts
~
```

Or Just simply click on the below url which is live and append running

For the main page to the login :

<http://18.219.132.59/>

To view the data from the database:

<http://18.219.132.59/database.html>
